

Assignment 6

The project draws to a close, you can see the finish line. All that remains is to polish the application and do the launch event. Then the CEO comes in with the news that the company was bought out, and he personally made a lot of money.

Your new corporate overlords inspect your work and think that it needs to be expanded, they hire a bunch of people to help. You swear these people think that 9 women can deliver a baby in a month.

- Join with the subgroup from the list below to finally become one team (20+ students) with the same project. Assignments are done by, and grades will be awarded to the new team.
- Once again, a shared group activity is part of the assignment. Yes, another party assignment. Most of the team should be there. Pics or it didn't happen.
- The team will present their work according to the following list:
 - 925/1 + 927/1 => Week 13, Thursday 16-18, L336
 - 922/1 + 924/1 => Week 13, Friday 12-14, MOS
 - 922/2 + 923/1 => Week 13, Friday 14-16, MOS
 - 926/1 + 925/2 => Week 14, Wednesday 18-20, L336
 - 927/2 + 921/1 => Week 14, Friday 10-12, MOS
 - 921/2 + 924/2 => Week 14, Friday 12-14, MOS
 - 923/2 + 926/2 => Week 14, Friday 18-20, L336
- The four leads will split into four roles:
 - Project manager
 - Quality assurance lead
 - Desktop technical lead
 - Web technical lead
- Project manager responsibilities:
 - Communications hub, knows all functionalities
 - Task prioritization and allocation of team members
 - Presents the demo
 - Breaks down grade and creates activity report
 - Does regular tasks
- Quality assurance lead responsibilities:
 - Manual and automated testing task creation of the applications
 - May create testing procedure and scenarios
 - Creation of bug tickets detailing what is wrong and how to reproduce it
 - Code review for all unit testing pull requests
 - Does regular tasks
- Desktop technical lead responsibilities:
 - Task creation for all things desktop (this might include the api layer)
 - Code reviews all desktop related pull requests, ensuring code quality and uniformity is maintained
 - Does regular tasks
- Web technical lead responsibilities:
 - Task creation for all things web (this might include the service and repository)
 - Code reviews all desktop related pull requests, ensuring code quality and uniformity is maintained
 - Does regular tasks

- Depending on your architecture the service and repository may be in a separate project from desktop / web, or it might be part of one of the web projects. However you decided to implement your solution, decide how the responsibilities are split, how team members are allocated, and who does the deployments.
- Create a new GitHub repository with the name: UBB-SE-2026-[CommunityHub / Movies / Jobs / Hospital / Banking / Airport / BoardGames] (e.g. UBB-SE-2026- CommunityHub). Invite the clients: course teacher ("imre-zsigmond" on GitHub), your lab assistant (ask for their id) as a collaborator.
- Merge the two projects into a singular solution. The coding style and architecture must be the same. There must be a single database for all of your data. All functionalities are to be accessible from both the desktop and web GUIs. GUIs must also be uniform and give the impression of a singular application. Tests must be updated.
- Attempt to "finish" the application. All functionalities must use the real data sources instead of the dummy ones created for earlier versions. Fix all the bugs. Within reason, implement missing functionalities that would make the application make more sense. So, if a couple of changes would make you be prouder of the final product, then do it.
- Your desktop applications must run in parallel with your website. If you chose to also separate your business logic last assignment, then you should be fine. If not, then you must now remove the business logic from the desktop and web applications. Change the APIs to expose the service layer instead of the repository. Change the desktop applications to call the new APIs. The server will have their ASP.NET core MVC GUI, and ASP.NET core API both use the same business logic, which will in turn use the same database access.
- You should already have MVVM, MVC, Observer and Proxy patterns in your code. Implement at least two other studied ones.
- Since you have two servers, try to use one for testing and one for production. Alternatively notify the teacher to tell IT to delete one and reallocate the resources to the other.
- Leads may denote their pick for "a +1 grade to any student" until their last lab after which it will default to them.

Ongoing requirements:

- The team lead will present a report before demoing their work on the contributions of each team member, ideally task/git/chat/sent files history etc. With the scope of proving that each team member did some non-negligible amount of work.
- Your solution must not contain any business logic in its UI or it's data access layer. As a reminder, MVVM, MVC and API is just the UI layer.
- Code readability, layering, style cop, test quality and coverage rules remain.

Optional:

- Try to start early and target getting everything done a couple of days before the deadline.
- Use tasks for work tracking and management.

Deadline: lab 7
(continued below)

About the product launch:

- At the last weekend of the semester, you will present your finished project in front of your peers. This is the culmination of all your work; this is your time to show off! Present the team, the project, then the running applications. If you had a blogger hand pick relevant sections of their work to tell your story when presenting your team. The solution must be shown from the deployed site and locally running application that connects to it. Make sure everything runs on two fully charged laptops, both of which have HDMI outputs.
- The presentation will be judged by a panel of 3 lab assistants. All team members will receive this grade without a breakdown.
- At the conclusion of their presentation, the team will receive a +0.01 bonus for each applauding non-team-member colleagues in the room to their final grade to a maximum of +1. This bonus only applies to the team members that are present.
- To qualify, blogs must be sent to Imre before Friday week 12.
